What is ITIL??
ITIL stands for Information Technology Infrastructure Library. It is set of rules to help improve value of services given by our Organization to the end user.

Phases of ITIL life cycle :-
1.Service Stratergy
2.Service Design
3.Service Transition
4.Service Operation
5.Continuel Service Improvements

Service Strategy :-
In service strategy we have to activate the plan. Whenever some project is going on so we have to gathered the all information from end user and higher management, business analyst so that is called service strategy. how the Data flow , how the service flow like that information.

Service Design :-
After that service Strategy we have to design the project that is called as service design.

Service transition :-
transition means transform form old one to new one. According to service strategy and service design we have to perform service transition.

Service Operation :-
One the application is done after that we have provide support to the end customer. What is the issue is facing

regarding that application.

Continual Service Improvements :-
Continual Service Improvement is a type of process which utilizes techniques from quality management so as to learn from prior success and failures and aims constantly to increase the efficiency and effectiveness of IT services and processes.

Incident :-
when an unplanned interruption or distruption is occurre then it it called as incident. Once incident occure then our application goes down so thats why we have to work on that type of incident and fix the incident.

Problem :-
same incident occure multiple times then it is called as problem. incident becomes a problem but problem never becomes an incident.

DR activity :-
DR activity means Disaster Recovery Activity.
After DR activity we have to perform health check or sanity check of application.

What is an incident? and What is Incident management?
You know sir, incident is an unplanned interruption because of that incident our application is goes down,its impact for our application. If same incident occure multiple time then we raise the PBI ticket means problem invistigate ticket with dev team.so incident becomes a problem. When the pbi ticket raise after that the developers works on that ticket and

get fixed it that problem.they have the proper code and we have to implement those code in production, but before implement those code in production we have to raise change request. Because we have to going change in our application or production support thats why the change request is raise by from our team L2 team. Incident becomes a problem and problem become a change request.

Request for change rfc :-
there are two types of change requests
1. Planned (90%)
2. Emergency level (unplanned)

CAB Meeting (Change Advisory Board) :-
When an incident occure and we know the problem then our Organization gathered CAB meeting of developers, testers ,linux team ,support team L1,L2,L3 team, database team, dev team, service lead ,network management team.

Whenever the rfc raise after that time scheduled a call called as CAB meeting .in that call we have discussing with our teammates on that topic what exactly change in this weekend or in Emergency level change. finally we are decided a plan what exactly we have to perform. So accordingly we have to change requests. Ones we raise change request then we have to take approval from higher management .application owener,lead manager,project manager required approval from all of this.

Emergency :-
Emergency level rfc means our application is going to totally down. That is one incident. So In Emergency level rfc that

time CAB meeting is not required.

When an unplanned rfc raise then without CAB meeting we have to find the solution and fix it.

SLA :-
SLA is service level agreement and terms and conditions and it is done by our Organization and end customer.

OLA :-
OLA stand for Operational Level Agreement. Operatinal Level Agreement it is an internal level agreement of any organization.

Control M tool :-
Autosis and control m tools both are working as same for job scheduling and monitor the job.

Priority :-
Usage + Impact = Priority
P1 -
P1 means high priority. We have send acknowledgement to the end customer within 10 to 15 min and resolve that issue within 24 hours.
P2 -
priority 2 is less priority than p1 and it should be resolve within 24 to 48 hours.
P3 and P4 -
P3 and P4 priorities are less priority and it should resolve within a week.
